BtcTurk Case Study

iOS Developer

Project Details

- Development must be with Swift.
- MVVM architecture is preferred but it’s up to you.
- Best practice implementations are preferable.
- Third party libraries can be used.
- The screens should be implemented according to the given design.
- Error handling should be implemented.

Project Details

Your iOS app must contains Pair List and Chart screen.

Pair List Screen:

- List pairs as vertical with api response data.
- A pair can be select as favorite and vice-versa. Local storage should be implemented.
- If there exist favorites, must be seen horizontal layout. Otherwise, the layout should be hide.
- If a pair is clicked, you should route to Chart screen.

Api: https://docs.btcturk.com/public-endpoints/ticker

Api Details

You should use bellow variables from services

- pair (ETHTRY)
- pairNormalized (ETH_TRY)
- volume
- dailyPercent
- last
- numeratorSymbol (ETH)

Project Details

Pair Chart Screen:

- The chart must be drawn with api response data.
- The informations of the held down point on the chart should be shown.

Chart Library : https://github.com/danielgindi/Charts

Api: https://docs.btcturk.com/public-endpoints/kline-data

Api Details

You should use bellow variables from services and set “time” variable in “x axis”, “close” variable in “y axis”.

- t (time)
- c (close)
